

A WELLNESS-TRACKING APPLICATION

Final Project Presentation for 6ADET
Benedict G. Sangalang
CS - 301

PROBLEM

WHO IS IT FOR

Students and busy young adults who want to build healthier habits but currently rely on memory, scattered notes, or nothing at all — including myself, someone who eats out often and loses track of water and sleep consistency because there's no single place logging it automatically.

LETS GET STARTED

DEMO

LOG IN

Provide an entry point for user accounts

REGISTER

Provide a creation of an account

DASHBOARD

Designed to give users a quick view of wellness information

DEMO

DAILY LOG

Intended for recording meals, water, sleep, and exercise

OVERVIEW

Summary for the recording meals of the day

PROFILE

Manage account information

TECH USED

- Flutter + Dart — build the application interface and app logic.
- Supabase — authentication and database functionality, depending on current implementation.
- Claude - creation of codes
- Gemini API — AI-related wellness functionality, depending on current implementation.
- Figma — used as the UI design reference.

CHALLENGES

- Translating the Figma mockup into Flutter widgets and layouts.
- Keeping the interface consistent across different pages.
- Handling form validation, including username and date-of-birth inputs. Connecting frontend screens to backend services and checking data flow.
- Using AI assistance responsibly by reviewing and understanding generated code.

NEXT STEPS

- Add health related features such as protein intake.
- Strengthen input validation and error handling.
- Verify Supabase authentication, database access, and profile data retrieval.
- Finish and test Gemini integration if it is part of the final build.
- Run end-to-end tests and refine the UI based on results.
